Abstract

1 To be completed...

2 1 Introduction

3 2 Preliminaries

4 Distributed Learning.

5 Sparse Optimization.

6 Sketch and Quantization based FL.

7 3 Method

8 Consider standard synchronous distributed optimization setting. AMSGrad is used as the prototype,
9 and the local workers is only in charge of gradient computation.

10 3.1 TopK AMSGrad with Error Feedback

11 The key difference (and interesting part) of our TopK AMSGrad compared with the following arxiv
12 paper “Quantized Adam”<https://arxiv.org/pdf/2004.14180.pdf> is that, in our model only
13 gradients are transmitted. In “QAdam”, each local worker keeps a local copy of moment estimator
14 m and v , and compresses and transmits m/v as a whole. Thus, that method is very much like the
15 sparsified distributed SGD, except that g is changed into m/v . In our model, the moment estimates
16 m and v are computed only at the central server, with the compressed gradients instead of the full
17 gradient. This would be the key (and difficulty) in convergence analysis.

Algorithm 1 SPARS-AMS for Federated Learning

```
1: Input: parameter  $\beta_1, \beta_2$ , learning rate  $\eta_t$ .
2: Initialize: central server parameter  $\theta_0 \in \Theta \subseteq \mathbb{R}^d$ ;  $e_{t,i} = 0$  the error accumulator for each
   worker; sparsity parameter  $k$ ;  $N$  local workers;  $m_0 = 0, v_0 = 0, \hat{v}_0 = 0$ 
3: for  $t = 1$  to  $T$  do
4:   parallel for worker  $i \in [n]$  do:
5:     Receive model parameter  $\theta_{t-1}$  from central server
6:     Compute stochastic gradient  $g_{t,i}$  at  $\theta_t$ 
7:     Compute  $\tilde{g}_{t,i} = \text{TopK}(g_{t,i} + e_{t,i}, k)$ 
8:     Update the error  $e_{t+1,i} = e_{t,i} + g_{t,i} - \tilde{g}_{t,i}$ 
9:     Send  $\tilde{g}_{t,i}$  back to central server
10:  end parallel
11:  Central server do:
12:     $\bar{g}_t = \frac{1}{N} \sum_{i=1}^N \tilde{g}_{t,i}$ 
13:     $m_t = \beta_1 m_{t-1} + (1 - \beta_1) \bar{g}_t$ 
14:     $v_t = \beta_2 v_{t-1} + (1 - \beta_2) \bar{g}_t^2$ 
15:     $\hat{v}_t = \max(v_t, \hat{v}_{t-1})$ 
16:    Update global model  $\theta_t = \theta_{t-1} - \eta_t \frac{m_t}{\sqrt{\hat{v}_t}}$ 
17: end for
```

18 3.2 Convergence Analysis

19 Nonconvex smooth loss function. Bounded gradient variance.

20 3.2.1 Single machine

21 We first define multiple auxiliary sequences. For the first moment, define

$$\begin{aligned}\bar{m}_t &= m_t + \mathcal{E}_t, \\ \mathcal{E}_t &= \beta_1 \mathcal{E}_{t-1} + (1 - \beta_1)(e_{t+1} - e_t),\end{aligned}$$

22 such that

$$\begin{aligned}\bar{m}_t &= \bar{m}_t + \mathcal{E}_t \\ &= \beta_1(m_t + \mathcal{E}_t) + (1 - \beta_1)(\bar{g}_t + e_{t+1} - e_1) \\ &= \beta_1 \bar{m}_{t-1} + (1 - \beta_1)g_t.\end{aligned}$$

23 TBD...

24 3.2.2 Multiple machine

25 4 Experiments

26 Our proposed TopK-EF with AMSGrad matches that of full AMSGrad, in distributed learning.
27 Number of local workers is 20. Error feedback fixes the convergence issue of using solely the
28 TopK gradient.

29 5 Conclusion

Figure 1: Test accuracy.
